

BUILT EXCLUSIVELY FOR THE IB WORLD SCHOOL

The Full Build, Explained.

A presentation script for school leadership — walking you through every portal, every intelligent feature, and the single idea beneath all of it: a platform that speaks IB, natively.

Audience: Principal, IB Programme Coordinators & Leadership Team

Format: Talking points + word-for-word narration + on-screen demo cues

Running time: ~35 minutes · **Status:** Confidential — internal presenter copy

0 How to use this script

BEFORE YOU BEGIN

PRESENTER'S NOTE

Each section opens with a **Talking Points** box — the three or four things that section must land, if you only remember those. Beneath it is the **full narration**: what to actually say, word for word, if you'd rather read than improvise. The highlighted **yellow phrases** are lines worth delivering verbatim.

Teal boxes are **on-screen cues** — what to click or show while you talk. Amber boxes are the **IB-Exclusive** point for that section: the recurring theme that this system was not adapted for IB, it was **born** for it. Return to that idea often; it is your single strongest differentiator.

■ Talking points ■ IB-Exclusive point ■ On-screen demo cue

1 Opening & the core idea

≈ 3 MINUTES

TALKING POINTS

- Most school software is generic, then bent to fit IB — badly. EduSphere 360 is the opposite.
- One promise: a platform that thinks in PYP, MYP and DP, not in generic "grades and percentages."
- Four connected portals — Admin, Teacher, Student, Parent — one shared source of truth.
- Frame the next 35 minutes: we'll walk each portal, then the intelligence layer that ties them together.

Good morning, and thank you for the time. I want to start not with a feature list, but with a frustration that I suspect you know well. **Almost every school management system on the market was built for a generic school — and then someone tried to bolt IB onto the side of it.** You end up entering criterion marks into a box meant for percentages. You describe a Personal Project in a field designed for a book report. The software fights your programme instead of serving it.

EduSphere 360 was built the other way around. **We started with the IB, and everything else followed.** When this platform talks about a grade, it means a 1 to 7. When it talks about assessment, it knows the difference between MYP criteria A to D and a DP paper marked out of 45. When it talks about a student's growth, it understands the learner profile and ATL skills as first-class ideas — not tags we added later.

Over the next half hour I'll show you the whole build. It comes in four connected portals — one each for your **administration and leadership**, your **teachers**, your **students**, and your **parents** — all drawing on a single, shared source of truth. Then I'll show you the layer of intelligence that sits on top, quietly doing the analysis your team currently does by hand, late at night, in spreadsheets.

► **ON SCREEN** Landing / login screen, then the Principal dashboard. Keep it on screen while you finish the intro.

★ IB-EXCLUSIVE BY DESIGN

Say it plainly up front and let it echo: **this is not a general platform with an IB skin. It is an IB platform.** Every screen we see today assumes the International Baccalaureate as its native language — and that assumption is the reason it fits your school and not the school down the road.

2 Why "IB-exclusive" actually matters

≈ 3 MINUTES

TALKING POINTS

- Generic tools force staff into translation work — mentally converting IB reality into non-IB fields.
- EduSphere removes that tax: PYP/MYP/DP structure, criteria A–D (0–8), HL/SL, TOK/EE/CAS, /45, ATL, learner profile are baked in.
- The demo school is a Bengaluru IB World School — so every name, venue, rupee figure and phone number is authentic to your context.
- The payoff: less data-wrangling, cleaner IB reporting, and a system your IB coordinators actually recognise.

Let me spend two honest minutes on why "IB-exclusive" is more than a marketing line. Every time a teacher uses a generic system, they pay a small tax I call **translation work** — they hold the real IB picture in their head and translate it into whatever boxes the software offers. Multiply that tiny friction across every teacher, every assessment, every report cycle, and it becomes hundreds of lost hours and a quiet trickle of errors.

EduSphere removes that tax because the IB structure is the structure. The programmes are PYP, MYP and DP — not "primary, middle, high." Assessment in the MYP is against criteria A to D on the nought-to-eight scale. The Diploma is HL and SL subjects, the core of TOK, the Extended Essay and CAS, and a total marked out of 45. ATL skills and the ten attributes of the learner profile appear where teachers plan and where students reflect. **None of that is a setting you have to switch on. It is simply how the system sees the world.**

You'll also notice, as we go, that this is unmistakably a school like yours. The demonstration data models a Bengaluru IB World School — Indian student and family names, local venues, fees in rupees, Indian phone numbers and addresses. **We didn't want you squinting at "John Smith" in "District 5" trying to imagine your own school. We wanted you to see it.**

★ IB-EXCLUSIVE BY DESIGN

This is the section where you set the lens for everything that follows. Tell them: **from here on, watch how often the software already knows what you mean — because it only ever had to understand one kind of school.**

3 The Admin & Principal command centre

≈ 6 MINUTES

TALKING POINTS

- A live operational dashboard for leadership — attendance, alerts and the school's pulse, auto-refreshing.
- Academic Setup & Calendar with national and Karnataka holidays plus IB exam-window sync.
- The standout: an AI timetable generator that builds a genuinely conflict-free schedule under real constraints.
- Full IB programme dashboards (PYP/MYP/DP), a CAS tracker, and staff PD & appraisal built on IB observation grades.
- Everything operational too — finance, fees, library, transport, hostel, canteen, assets — under one roof.

Let's start where you sit — leadership. The first thing you get is a **live operations dashboard**. It refreshes itself roughly every thirty seconds, so what you're looking at is the school right now: who's present, what needs attention, where the day is running smoothly and where it isn't. **It's the difference between asking "how are we doing?" and simply looking up and seeing.**

► **ON SCREEN** Admin → Live Ops dashboard. Let the auto-refresh tick once so they see it update on its own.

From there, **Academic Setup and the Academic Calendar**. This is where the year is shaped — and it already carries national holidays and Karnataka state holidays, and it syncs the IB examination windows so your planning and the IB's calendar never drift apart. Next to it sits the feature I'd most like you to watch closely: the **AI timetable generator**. Building a school timetable by hand is one of the most painful jobs in any institution. You feed it your constraints — teachers, rooms, subjects, the shape of the week — and it produces a **genuinely conflict-free schedule**, with no teacher double-booked and no room clash, and it writes that schedule safely in one transaction so you never end up with a half-saved mess.

► **ON SCREEN** Admin → Timetable → run the AI auto-generator; show the conflict-free result.

Then the heart of it for an IB school: the **programme dashboards**. PYP, MYP and DP each get their own view, speaking their own language. Alongside them is a **CAS tracker** that shows each student's balance across Creativity, Activity and Service and nudges the ones falling behind. And for your staff, there's a proper **professional development and appraisal module** — logging CPD hours, recording lesson observations on an IB one-to-seven scale, and showing you trends across academic years, so appraisal conversations are grounded in evidence rather than memory.

► **ON SCREEN** Admin → IB Programmes (flip PYP/MYP/DP tabs) → CAS Tracker → Staff → PD & Appraisal.

And because a school is more than its classrooms, everything operational lives here too — **finance and fees, library, transport, hostel, canteen, assets, resources, admissions records and user management.** One platform, one login, one place where leadership can see the whole institution.

★ **IB-EXCLUSIVE BY DESIGN**

Point at the programme dashboards and the CAS tracker specifically: **a generic system has none of this. It has "classes" and "activities."** Here, the CAS strands and the PYP/MYP/DP split exist because the IB exists — the admin tools were shaped around your programmes, not the reverse.

4 The Teacher portal

≈ 6 MINUTES

TALKING POINTS

- Designed to give teachers time back — the IB lesson-plan builder is the centrepiece.
- Plans are built from units, ATL skill chips, and learner-profile attributes, with a live coverage meter.
- One-tap substitute-plan generation for the day a teacher is out — continuity without the scramble.
- Attendance, assignments, grading, quizzes with a create → moderate → release flow, and live class reports.
- Teachers track their own PD against a 30-hour target and see their observation feedback.

If leadership is about seeing the whole, the teacher portal is about **giving your best people their evenings back**. The centrepiece is the **IB lesson-plan builder**. A teacher builds a plan the IB way — around units of inquiry or study, tagging the ATL skills the lesson develops and the learner-profile attributes it draws on. A live **coverage meter** shows, at a glance, whether their planning is genuinely balanced across the year or quietly over-weighting one area.

► **ON SCREEN** Teacher → Planner. Build or open a plan; show the ATL chips, learner-profile tags, and the coverage meter moving.

Here's the moment that tends to win teachers over. When a teacher is unexpectedly away, the usual result is a lost lesson and a stressful morning. This portal offers **one-tap generation of a substitute plan** — a coherent, ready-to-run lesson a cover teacher can pick up and deliver, so learning continues instead of stalling. **That's not a gimmick; that's a real Tuesday when someone's child is sick.**

► **ON SCREEN** Teacher → Planner → "Generate substitute plan." Show the produced plan.

Around that sit all the daily tools done properly: **attendance, assignments, and grading** that understands IB marking. There's a full **quiz workflow** — a teacher creates a quiz, moderates the results, and then releases them deliberately, so marks are never visible before they're ready. And **live class reports** mean a teacher can see how a whole class is tracking without exporting anything or building a spreadsheet.

► **ON SCREEN** Teacher → Assignments / Grading, then Quizzes (create → moderate → release), then Reports.

Finally, teachers get their own **professional-development view** — their CPD logged against a thirty-hour target, and the feedback from their observations in one place. Growth becomes visible to the person who has to do the growing, which is exactly where it should be.

★ **IB-EXCLUSIVE BY DESIGN**

Land this hard: **the lesson-plan builder is not a generic planner with an "IB" label. Its raw materials are ATL skills and learner-profile attributes.** A teacher from a non-IB school would not recognise these building blocks — a teacher from yours will feel instantly at home.

5 The Student portal

≈ 6 MINUTES

TALKING POINTS

- "My Subjects" is the all-in-one home — resources, a grade-history chart, and every assessment result per subject.
- Grades are shown the IB way: DP out of 45, MYP by criteria, PYP as narrative — never a raw percentage.
- A real IB-style report card the student can print to PDF.
- An Exams area mirroring IB reality — Paper 1/2/3, IA deadlines, MYP eAssessments.
- A secure lockdown exam mode: fullscreen, navigation hidden, copy and right-click blocked, three violations auto-submits.

Now the students — because a platform that only serves adults isn't serving the school. Their home is a screen called **My Subjects**, and it's deliberately all-in-one. For each subject a student sees their **resources**, a **chart of their grade history**, and **every assessment result** they've earned. No hunting across five places for one answer to "how am I doing in Biology?"

► **ON SCREEN** Student login (use the DP student with the richest data) → My Subjects. Open one subject to show the grade-history chart and results.

And here's a detail I want to dwell on: a student never sees a raw percentage, because the IB doesn't work in percentages. A Diploma student sees their points out of 45. An MYP student sees achievement against the criteria. A PYP child sees narrative description. The system refuses to flatten IB assessment into a number it was never meant to be — and then it produces a proper **IB-style report card** the student can print straight to PDF.

► **ON SCREEN** Student → My Grades (show the /45 DP view and the MYP criteria view) → Report Card → print preview.

The **Exams** area mirrors the real rhythm of an IB year — Paper 1, 2 and 3, internal-assessment deadlines, MYP eAssessments. And built into it is something I'm genuinely proud of: a **secure lockdown exam mode**. When a student sits an online assessment, the app goes fullscreen, the navigation disappears, and copy-paste and right-click are blocked. If a student leaves the exam window too many times, it auto-submits. It turns any device into a controlled exam environment — no extra software to install.

► **ON SCREEN** Student → Exams → start the takeable quiz to demonstrate lockdown mode (fullscreen, blocked actions).

★ IB-EXCLUSIVE BY DESIGN

This is your most vivid proof point. Say it directly: **the system will not show a percentage, because the IB is not a percentage system**. DP out of 45, MYP by criteria, PYP by narrative — the student experience is shaped by the assessment philosophy of the IB itself.

≈ 3 MINUTES

TALKING POINTS

- Parents get calm, honest visibility — not a firehose, and not a black box.
- Timetable, attendance, an IB-shaped gradebook, discipline notes, meeting bookings and fees, all in one place.
- A direct messaging channel to the school, plus a live bus-tracking view.
- Because parents read the same IB-native grades, school-home conversations finally use one shared language.

Parents are the fourth portal, and the design principle here is **calm, honest visibility**. Not a firehose of every notification, and not a black box they have to phone the office to understand. A parent logs in and sees their child's **timetable, attendance, gradebook, and any discipline notes**. They can **book meetings** with teachers, **view and manage fees**, follow a **live bus-tracking** view on the school run, and **message the school** directly.

► **ON SCREEN** Parent login → Dashboard → Gradebook → Fees → Live bus tracker.

The quiet win is consistency. Because the parent is reading the very same IB-native grades the teacher entered and the student sees, everyone is finally speaking one language. **When a parent asks about their child's progress, you're no longer translating IB into "percentages for parents."** You're all looking at the same true picture.

★ IB-EXCLUSIVE BY DESIGN

Make the throughline explicit: **the same IB grade flows, unbroken, from teacher to student to parent**. A generic system would convert it somewhere along that chain and lose meaning. Here the IB assessment stays intact from the moment it's entered to the moment a parent reads it.

7 The intelligence layer

≈ 4 MINUTES

TALKING POINTS

- Two things are already fully working and real: automated grading assistance and the timetable generator.
- A wider AI suite is built and visible as guided previews — early-warning signals, workload balancing, sentiment, attrition, and more.
- Be transparent: the preview features show the finished experience; wiring them to a live AI engine is the next milestone.
- Every role also has a floating AI assistant with quick actions tailored to that role.
- The vision: the analysis your team does by hand, done continuously and surfaced early.

Now the layer that ties it together. I want to be scrupulously honest here, because you'll respect that more than hype. **Two pieces of intelligence are fully real and working today:** the **automated grading assistance** and the **timetable generator** you already saw solve a genuine constraint problem.

Beyond those, there's a broader **AI suite** — early-warning flags for students who may be slipping, anomaly detection, teacher-workload balancing, sentiment reading of pastoral notes, retention insight, and more. These are **built and visible as guided previews:** the screens, the flow and the experience are all there and polished. **What's next is connecting them to a live AI engine so they run on your real data, continuously.** I'd rather show you exactly where the line is than pretend it isn't there.

► **ON SCREEN** Admin → AI Insights hub. Walk two or three preview cards. Then trigger the floating AI assistant to show role-specific quick actions.

Every role also carries a **floating AI assistant** — a principal, a teacher, a student and a parent each get an assistant that understands their world and offers quick actions suited to it. The destination is simple to describe: **the careful analysis your team currently does by hand, late and occasionally, done continuously and surfaced early — while there's still time to act.**

★ IB-EXCLUSIVE BY DESIGN

Even the intelligence is IB-aware: **an early-warning signal here reads IB progress — criterion trends, predicted grades, CAS balance — not a generic average.** The insights are only as relevant as the model beneath them, and this model is the IB.

8 Built on real, believable data

≈ 2 MINUTES

TALKING POINTS

- This isn't three empty screens — it's a fully populated school you can stress-test.
- 173 students, each with a class, a login, a linked parent, IB subject records, and real assessment and attendance history.
- 15 teachers with PD records and dozens of observations across three academic years.
- Finance, messages, resources, clubs, calendar and quizzes are all seeded — so every screen has life in it.
- All of it authentically Indian and Bengaluru-based, so it reflects your world, not a template.

One thing that separates a real product from a mock-up is **whether the screens have life in them**. Everything I've shown you is running on a fully populated demonstration school. There are **173 students** — and each one has a classroom, a portal login, a linked parent with an Indian name and a Bengaluru address, IB subject records with current and predicted grades, real assessment history, and attendance history. There are **fifteen teachers** with their own PD records and dozens of lesson observations spanning three academic years.

Around them, the whole institution is seeded — **invoices and payments, messages, subject resources, clubs and their activities, a full calendar, and live quizzes**. **You can click into almost anything and find a plausible, consistent school looking back at you** — and because the data is authentically Indian and local, it's your world, not an American template with the names swapped.

► **ON SCREEN** Optional: Admin → Students → Registry. Filter or search to show the depth of records, then open one rich student profile.

★ IB-EXCLUSIVE BY DESIGN

Note that the seeded data itself is IB-shaped: **students are placed in PYP, MYP and DP; their records carry predicted grades, criterion results and core components**. Even the test data couldn't have come from a generic school — it's IB all the way down.

≈ 2 MINUTES

TALKING POINTS

- Be candid — this builds trust: today's build is a demonstration, not yet hardened for live student data.
- Before real families are on it, security is upgraded: proper password protection, secrets management, audit trails, two-factor.
- Roadmap items: connecting the AI previews to a live engine, a payment gateway, WhatsApp/SMS/email, payroll compliance, Excel import (now live), and more.
- Position gaps as a deliberate, sequenced plan — not surprises.

I'll close the walkthrough with candour, because you're trusting this platform with children's data and you deserve straight talk. **What you've seen today is a demonstration build — deep and real, but not yet hardened for live student information.** Before a single real family logs in, we complete a security pass: proper password protection, managed secrets, a full audit trail of who did what, and two-factor sign-in. That work is understood and scoped; it comes before go-live, not after.

The roadmap beyond that is clear and sequenced: **connecting the AI previews to a live engine**, a **payment gateway** for fees, **WhatsApp, SMS and email** channels, **Indian payroll compliance** outputs, and bulk tools like **spreadsheet import** — which, in fact, we've just built and shipped, so admissions officers can bring a whole cohort in from an Excel or CSV file in minutes. **None of these are surprises. They're a plan.**

★ IB-EXCLUSIVE BY DESIGN

Reassure them that the foundation is the hard part, and it's done: **the IB-native core — the assessment models, the programme structures, the planning tools — is the part that can't be bought off a shelf. Everything remaining on the roadmap is standard engineering on top of an IB foundation that already exists.**

10 Closing & the ask

≈ 2 MINUTES

TALKING POINTS

- Recap the through-line: one platform, four portals, one IB-native truth flowing between them.
- Restate the differentiator once more — built for the IB, not adapted to it.
- Make a clear ask: a pilot with one programme, or a working session to map it to your exact structure.
- Invite questions; hand to Q&A.

So let me draw it together. You've seen one platform with four connected portals — leadership, teachers, students and parents — all sharing a single IB-native source of truth, with an intelligence layer beginning to do the analysis your team does by hand. Underneath every screen is one idea I hope has become impossible to forget: **this was built for the IB, not adapted to it.**

What I'd like from today is a next step, not a signature. The most useful thing would be a **focused pilot** — pick one programme, PYP, MYP or DP, and let us stand it up against your real structure — or a **working session** where we map the platform onto your exact school and show you your own data flowing through it. **You've seen what it does. I'd like to show you what it does for you, specifically.**

Thank you. I'd love to take your questions.

Appendix: Q&A preparation

ANTICIPATED QUESTIONS & STRONG ANSWERS

"How is this different from the systems we've already been pitched?"	Every one of those started generic and added IB later. This one started with the IB and added everything else. That ordering shows up on every screen — from grades never being percentages, to lesson plans built from ATL skills and the learner profile.
"You said some AI features are previews. What actually works today?"	Two things are fully real: the automated grading assistance and the conflict-free timetable generator, which solves a genuine constraint problem live. The wider AI suite is built and visible as polished previews; the next milestone is wiring them to a live engine on your real data. We show you exactly where that line is.
"Is our students' data safe on this?"	Today's build is a demonstration and is not yet hardened for live data — we're upfront about that. Before any real family is on it, we complete a security pass: proper password hashing, managed secrets, a full audit trail, and two-factor authentication. That's a pre-go-live requirement, not an afterthought.
"Can it handle our fees, transport, and day-to-day operations too?"	Yes — finance, fees, library, transport, hostel, canteen, assets and admissions all live in the same platform, under one login. A live payment gateway and messaging channels are on the near-term roadmap.
"How hard is it to get our real data in?"	We've just shipped a bulk import tool: upload an Excel or CSV file, map the columns, review every row's validation, and commit — creating students, logins and linked parents in one pass. Onboarding a cohort takes minutes, not weeks.
"What would a pilot actually look like?"	Pick one programme. We stand the platform up against your real structure and a slice of your data, run it alongside your current process for a defined period, and measure the time your staff get back and the clarity your parents gain. Low risk, concrete evidence.
